Facts about Optique

- ▶ Large-scale integrating project (IP) under FP7-ICT Objective 4.4 Intelligent Information Management
 - ▶ 155 proposals in total (IP+STREPS)
 - ▶ Optique ranked 2nd, 14 of max 15 points
 - ▶ 35 IP proposals, 2 funded
- ▶ Total budget: 13 800 000 €
- ▶ EU contribution: 9 760 000 €
- ▶ Duration: 4 years
- ▶ Start: November 1 2012
- ▶ Annual reviews in December
- ▶ Annual plenary meetings in May/June

Scalable End-user Access to Big Data

Up to **80%** of experts' time spent accessing Big Data

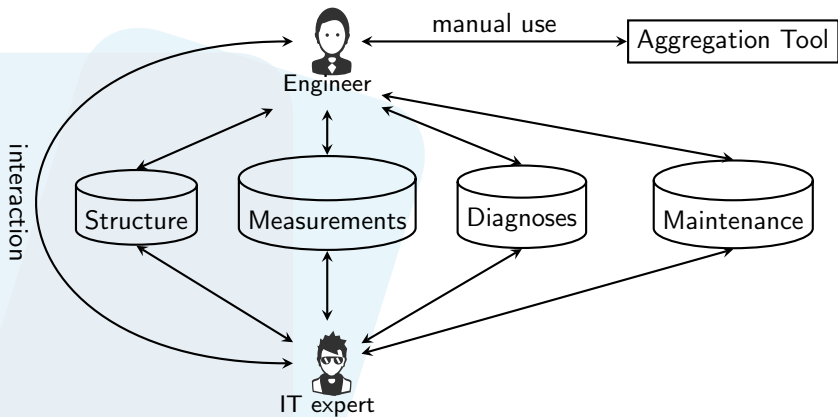

Current situation for Statoil Exploration:

- ▶ Query development takes several days
- ▶ ProSource turns out to be difficult in use
- ▶ Including other sources in queries is difficult/impossible

Current situation for Siemens Turbines

Challenging Questions for Siemens Turbines

- ▶ List all sites where a component of type "C" in version "3.2" is used, which has not been serviced within the last 6 months. (*e.g. for service planning*)
- ▶ Determine all turbines showing an error of type "X" defined by at least 5% decrease of quality "Q1" measured at component "C1" within the last month, followed by a statistically significant increase of quality "Q2". (*e.g. for turbine diagnostics*)
- ▶ List all turbines for which one of the last five services comprised action "A" followed by action "B", but not action "C". (*e.g. for maintenance quality check*)

Main Innovation: End-to-End Connection

Intelligent, integrated, scalable system:

Turnaround times: weeks → hours

SIEMENS

Up to 80% time
on data access

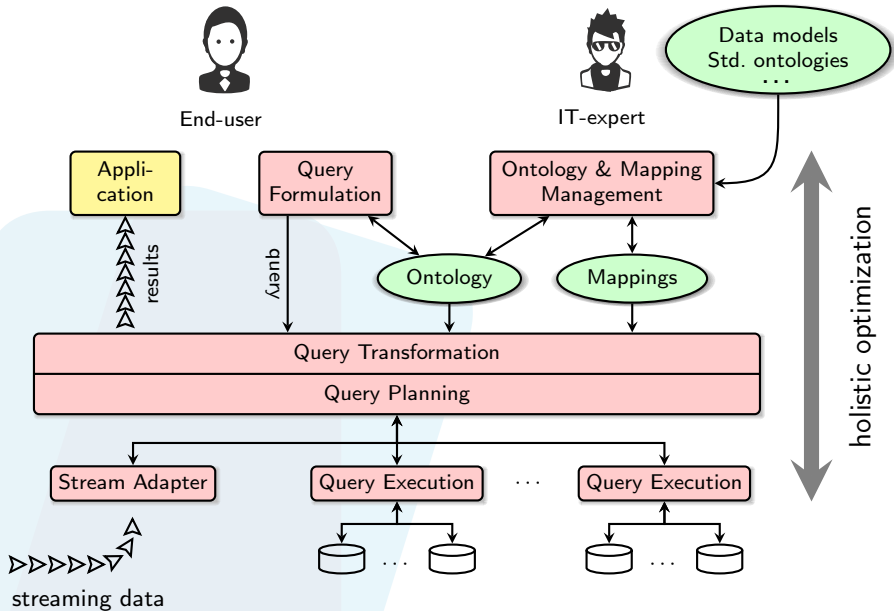

Up to 70% time
on data access

Time that should be freed for core tasks!

World leading Consortium

Shaping the future of ICT

Query Transformation & Planning

Plug-ins

structured queries

ADP

- ▶ data-flow query lang.
- ▶ platform independence
- ▶ query optimisation for massively parallel execution
- ▶ extensible query lang.
- ▶ elasticity

Public Cloud

Existing Storage

Private Cloud

Optique extensions of ADP:

- ▶ federation support
- ▶ temporal queries
- ▶ continuous queries

Optique

Real-time
Stream Processing

Query Evaluation
with Elastic Clouds

Velocity

Volume

NoSQL:

- + scalability
- + elasticity
- weak structure
- weak query lang.

Parallel SQL:

- + parallel analytics
- + in-DB MapReduce
- integration difficult
- no streaming

Variety

Complexity

Scalable
Query Rewriting

Semantic Web:

- + strong reasoning
- + ont.-based integration
- no streaming
- poor scalability

End-user-oriented
Query Interface

Optique Platform

SIEMENS

Velocity

30 GB/24h

PetroBank

3 PB

Query Catalogue for Requirements and Evaluation

- Query formulation ▶ 90% success
- Turnaround time ▶ from weeks to hours
- Data volume ▶ from TB to PB

4 Project phases

Y1

- ▶ Integrate existing components
- ▶ Get acquainted with use cases

Y2

- ▶ User vocabulary (stratigraphy, etc.)
- ▶ Mappings to EPDS

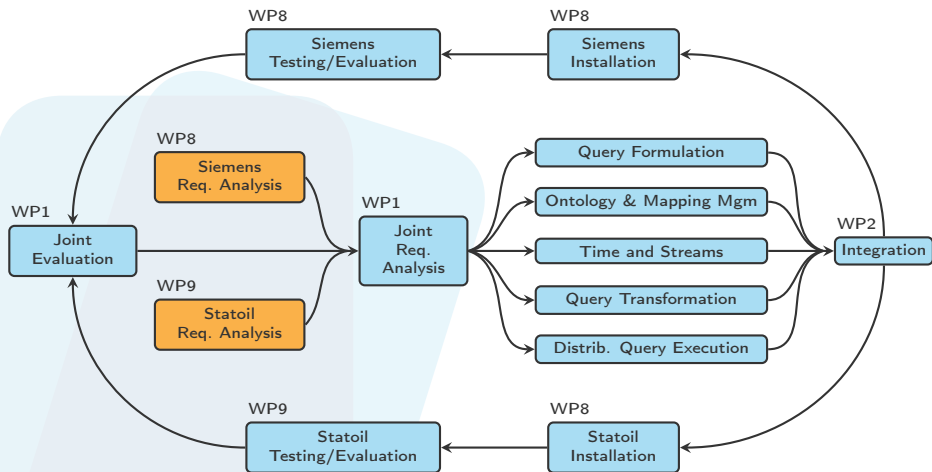

Y3

- ▶ Integrate project databases
- ▶ Differing data models

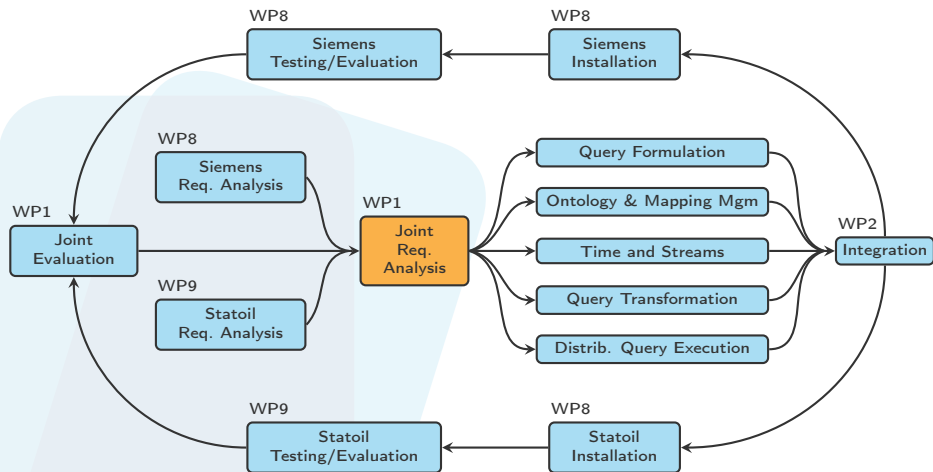

Y4

- ▶ Performance optimisation
- ▶ Usability improvements

WP3: Query Formulation

What: Front-end component to help non-technical users formalize their information needs

- How:**
- ▶ Query by Navigation
 - ▶ Query by Example?
 - ▶ Faceted Querying?
 - ▶ Direct Editing for experts
 - ▶ Query-driven ontology construction

Who: Oxford University, University of Oslo

WP4: Ontology and Mapping Management

What: Creation, evolution, transformation & management of

- ▶ ontologies
- ▶ mappings

How:

- ▶ “Bootstrapping” of ontologies and mappings from existing models using ontology alignment and approximation techniques
- ▶ Bottom-up refinements on demand
- ▶ New framework/metamodel for analysing and manipulating sets of mappings

Who: Sapienza Univ. of Rome, most of the partners

WP5: Time and Streams

What: Semantics, Queries, and Query Rewriting for

- ▶ time-stamped (historical) data
- ▶ streaming (real-time) data

How:

- ▶ Extended query language (C-SPARQL?)
- ▶ Optimization of query rewriting for temporal data
- ▶ Data mining and query log analysis (caching)

Who: TU Hamburg-Harburg, Siemens, Univ. of Athens

WP6: Query Transformation

What: Rewriting user queries to data source queries

- ▶ efficient rewriting
- ▶ efficient queries output

How:

- ▶ Established OBDA methodology
- ▶ + utilize existing structure in sources
- ▶ + storing auxiliary information in data sources

Who: Free Univ. Bolzaono, Sapienza Univ. of Rome

WP7: Distributed Query Execution

What: Query planning and execution

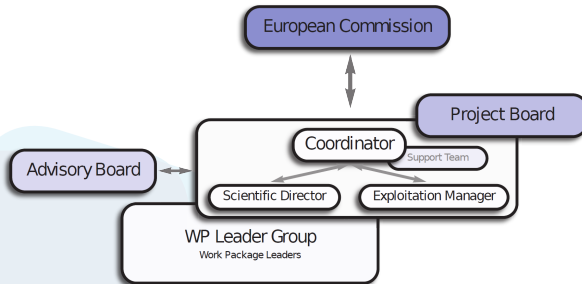

- ▶ “standard”/temporal/continuous
- ▶ distribution to disparate sources (federation)
- ▶ highly scalable

How:

- ▶ existing ADP framework for cloud storage/querying
- ▶ + federation support
- ▶ + temporal queries
- ▶ + continuous queries

Who: Univ. of Athens, Sapienza Univ. of Rome

Management structure

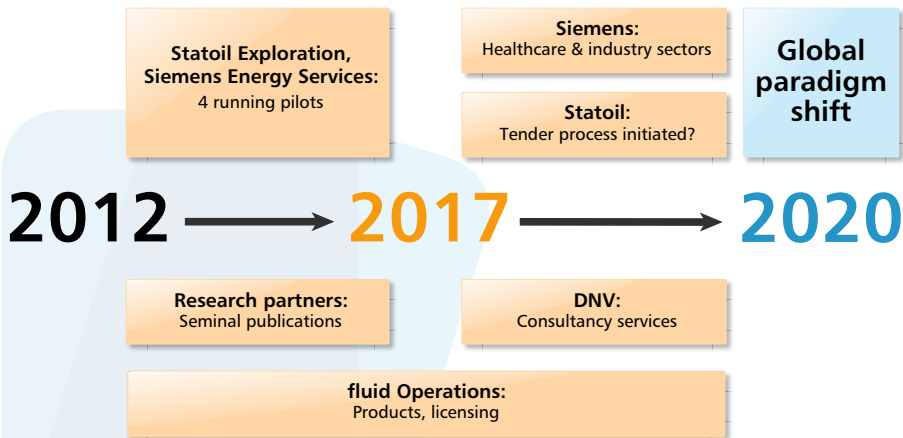

Management:

- ▶ One from each partner in WP leader group and in Board
- ▶ Board meetings twice a year at plenary meetings
- ▶ WP leader meetings at least every 3rd week, virtual
- ▶ Advisory Board meets once a year

Advisory Board

- ▶ Morten Thorkildsen, Country general Manager, IBM Norway
- ▶ Joe King, Director of Strategy, Landmark R&D
- ▶ Bjørn Olstad, General Manager for Search and Enterprise Content Management, Microsoft Development Center Norway
- ▶ Rune Syverinsen, Technical Director, Oracle Nordics
- ▶ Vasu Guruswamy, Vice President Schlumberger Information Solutions

Towards a Global Paradigm Shift

Exploitation through the Optique Ecosystem
