

Ontologies and Silos

A view from the field

Chris Welty
IBM Research

Taxonomy integrating DOLCE and COM basic categories

Semantic Web Standards News

- RDF (pre WG)
 - Looking at adding *named graphs*
 - SPARQL (WD)
 - Adding update, aggregates
 - Fixing inference profiles
 - OWL (Rec)
 - Punning, relation composition
 - RIF (PR)
 - Exchange of rules for RDF data
-

Ontology is *not*...

- A technology
- A kind of logic (description, modal, context, ...)
- A standard
- OWL
- The semantic web
- A taxonomy
- Reasoning
- An efficient algorithm

Ontology is...

- *A shared view of the kinds of entities* that exist in the world, and how they are related
 - Independent of how this is communicated and specified
- The result of disciplined analysis to capture *objective reality*
- to information systems design what Software Architecture is to software design
- *Supported by* certain technologies (with which it is often confused)

Software Architecture

- Driven by two principle factors:
 - The increasing *size* of software systems raised the principle concern of software engineers “beyond the algorithms and data structures of the computation”
 - The increasing cost of long-term *maintenance* of software systems focused awareness on “design for change”
- These factors derived from analysis of the software life-cycle
 - Design should account for the principle *long-term costs* of the system (“change is inevitable”)
 - What is the information systems life-cycle?

Information System Life-Cycle

- Change (aka schema drift)
 - Fixed-schema information systems will need to change, imposing a significant long-term maintenance cost
- Integration/interoperation
 - There is no “one ring” to rule them all
 - Integration is inevitable
- Design for change, design for interoperability

Integrate!

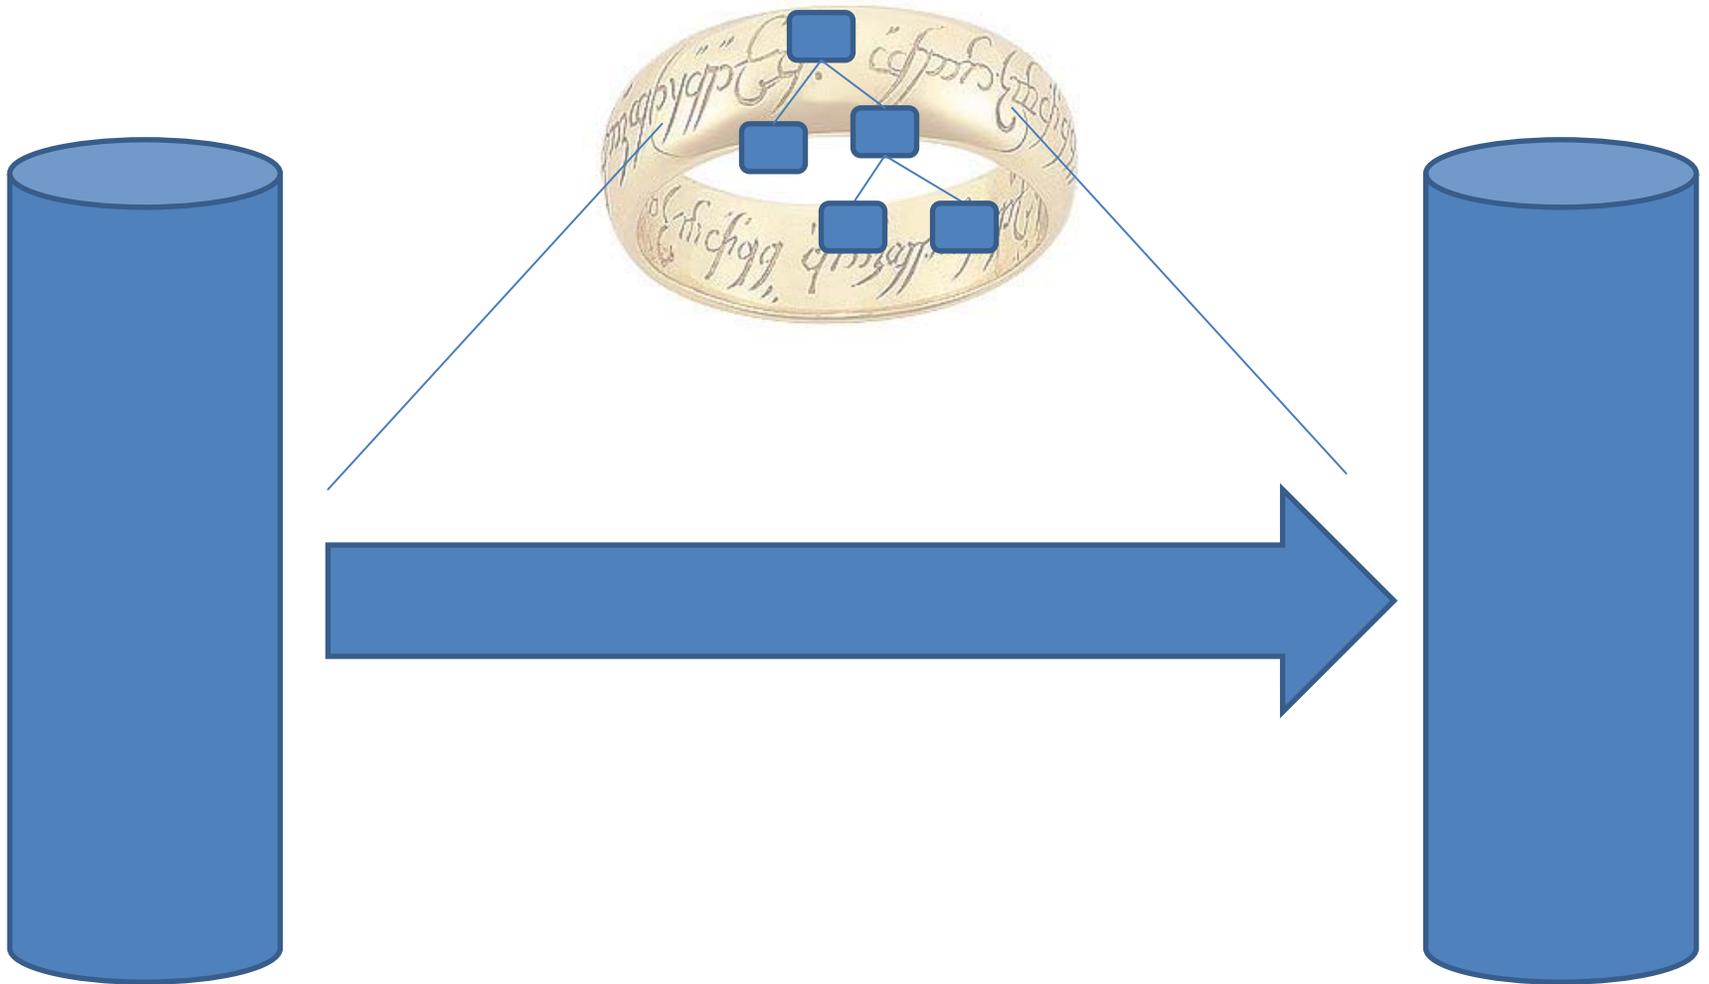

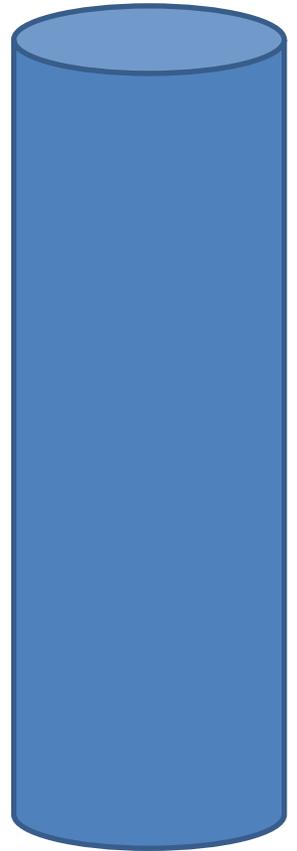

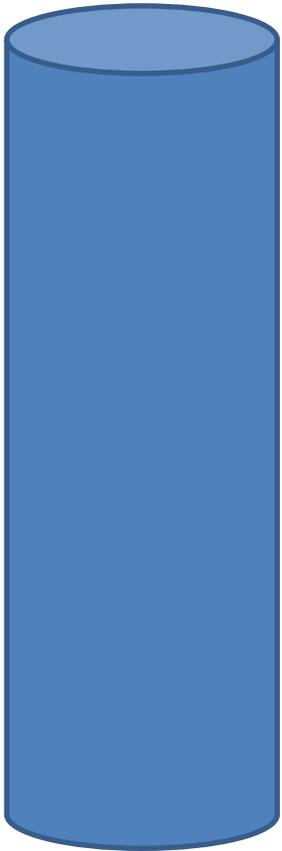

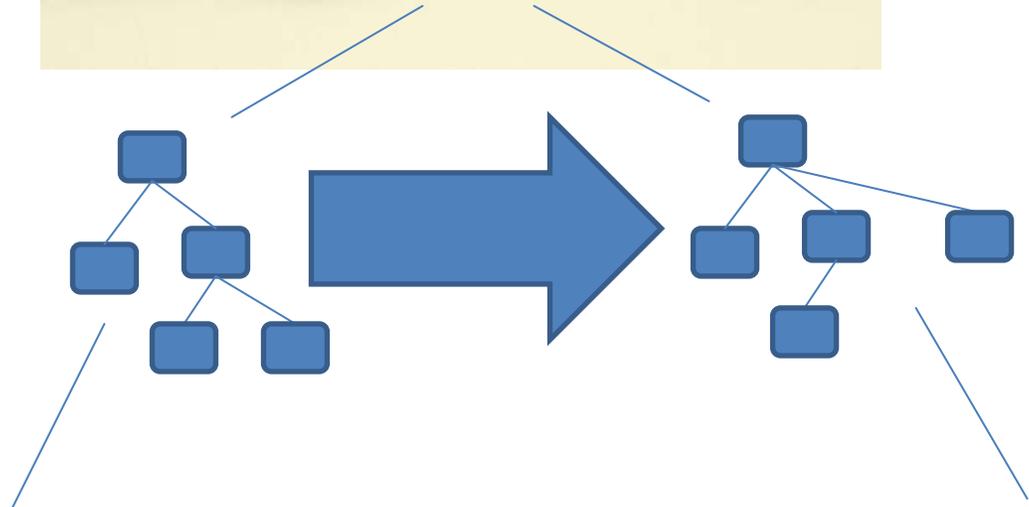

Ontology

- Human communication is ultimately grounded in the world around us
- Information systems design should be likewise grounded

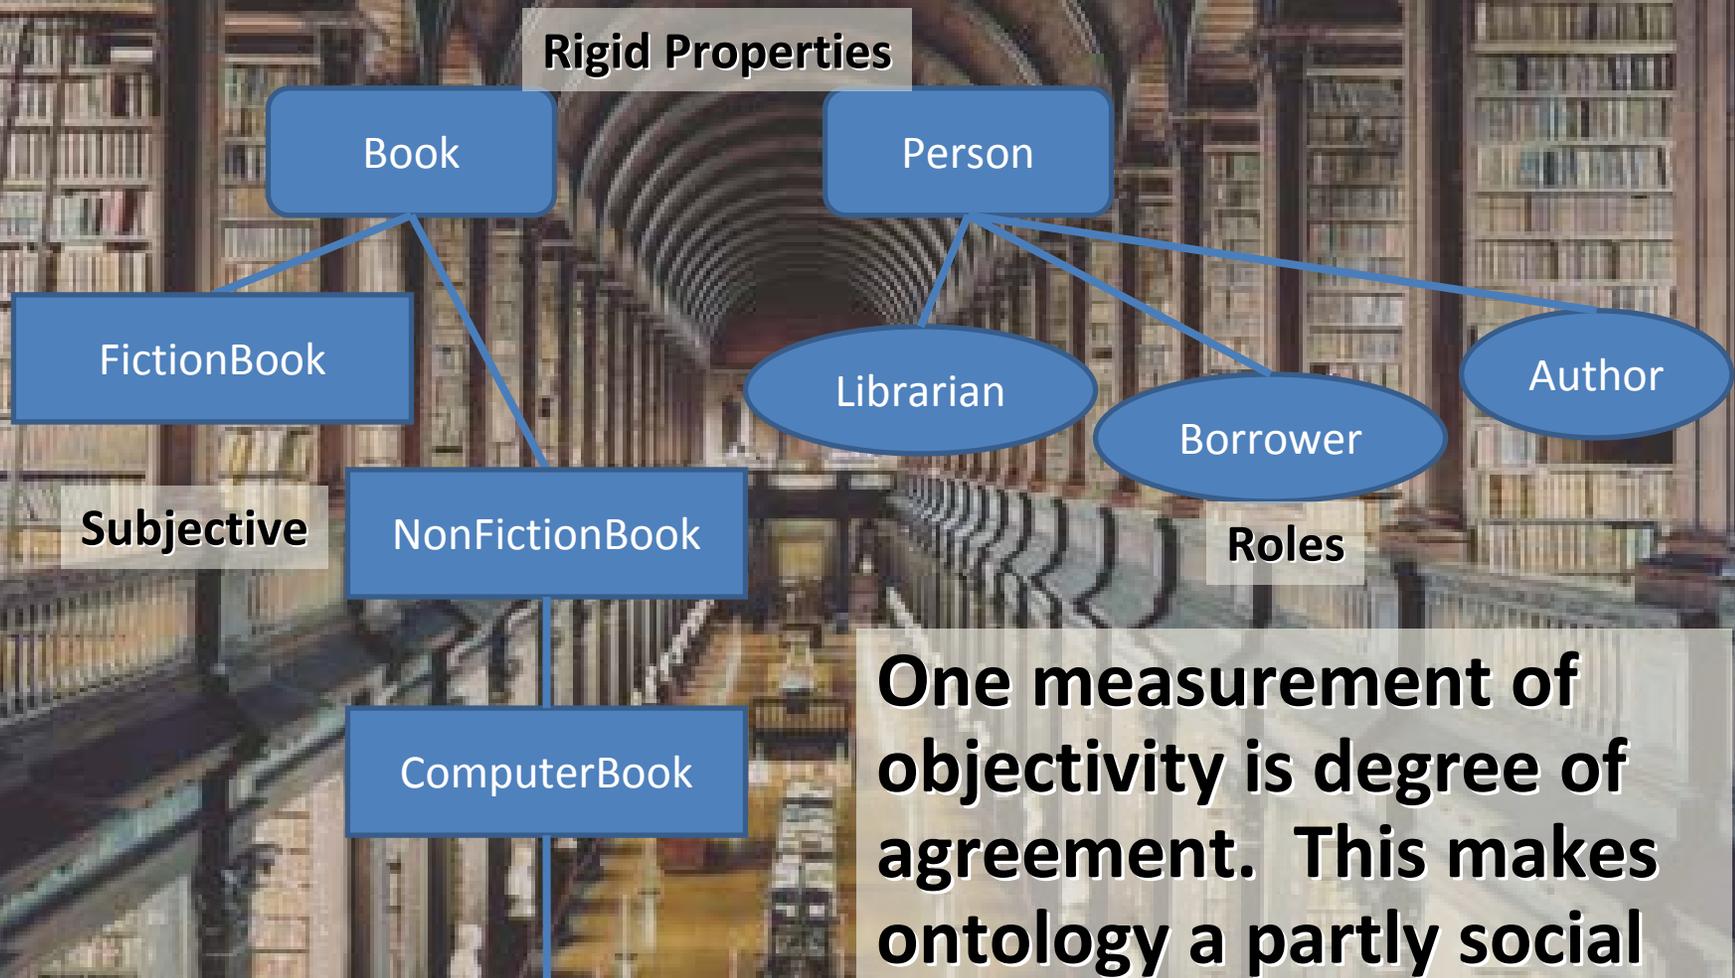

An ontology vs. ontology

Objective vs. Subjective Reality

Subjective

Rigid Properties

Book

Author

Roles

2001: A Space Odyssey

One measurement of objectivity is degree of agreement. This makes ontology a partly social process.

Objective Reality

Rigid Properties

Conclusions

- **Ontology is not a technology**
- **Design for interoperability**
- **Ontologies should be founded on an objective view of reality**

Objective vs. Subjective Reality

- Ontologies can help reduce silos
...but bad ontologies make the problem worse
- Ontology is *not* a technology, but what technologies support ontology?

Semantic Web

- *is not...*
 - A technology
 - An organization
 - Ontology
 - OWL, RDF, ...
- *Is ...*
 - An idea: linking data
 - Providing identifiers for entities, relations
 - Supported by technologies like http, RDF, OWL, and RIF

Linking with Web Ids (URIs)

Semantic Web Standards

- RDF
- SPARQL
